Attorney's Docket No.: 05542-170006 / 881D5/CMP

Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Previously Presented) A polishing apparatus, comprising:
a rotatable support member rotatable about a first axis;
at least two polishing surfaces arranged at respective angular positions about said first axis;
at least one substrate head assembly supported on said rotatable support member and capable of supporting thereon a substrate in contact with a selected one of said polishing surfaces and affording relative linear and reciprocal movement between said selected polishing surface and said substrate head assembly while said substrate supported on said substrate head assembly is engaged with said selected polishing surface;
wherein said at least one substrate head assembly is linearly and reciprocally movable in said rotatable support member.
2. (Previously Presented) The polishing apparatus of Claim 1, wherein said at least two polishing surfaces are movable.
3. (Previously Presented) The polishing apparatus of Claim 2, wherein said at least two polishing surfaces are rotatable.
4. (Previously Presented) The polishing apparatus of Claim 3, wherein said at least one substrate head assembly comprises at least two substrate head assemblies capable of supporting thereon respective substrates.

Attorney's Docket No.: 05542-170006 / 881D5/CMP

5. (Previously Presented) The polishing apparatus of Claim 4, wherein said at least two substrate head assemblies are simultaneously positionable to respective horizontal positions corresponding to respective ones of said at least two polishing surfaces.

6. (Previously Presented) The polishing apparatus of Claim 5, wherein at least two of said substrate head assemblies are linearly and reciprocally movable in said rotatable support member independently of each other.

7. (Previously Presented) The polishing apparatus of Claim 6, further comprising at least two motors mounted on said rotatable support member and coupled to respective ones of said substrate head assemblies to move them linearly and reciprocally in said rotatable support member.

8. (Previously Presented) The polishing apparatus of Claim 7, wherein said substrate head assemblies are slidably mounted in respective linear slots formed in said rotatable support member, and
further comprising:

at least two lead screws independently rotated by respective ones of said motors; and
threaded members mounted to respective ones of said substrate head assemblies and
threadably and rotatably receiving respective ones of said lead screws.

9. (Previously Presented) The polishing apparatus of Claim 8, wherein said slots have open ends in said rotatable support member opposite said first axis and wherein each of said substrate head assemblies includes a respective head motor, and a substrate holder for selectively holding a substrate, wherein said substrate head assemblies are insertable in said slots from said open ends with said head motors disposed above and extending laterally of said slots and with said substrate holders disposed below and extending laterally of said slots.

Attorney's Docket No.: 05542-170006 / 881D5/CMP

10. (Previously Presented) The polishing apparatus of Claim 9, wherein said substrate head assemblies are linearly and reciprocally movable along respective radii of said rotatable support member passing through said first axis.

11. (Previously Presented) The polishing apparatus of Claim 10, wherein each of said head assemblies includes a vertically movable substrate head providing sufficient vertical movement to engage and disengage a substrate held thereon from said selected polishing surface.

12. (Withdrawn) A polishing method usable in an apparatus comprising a rotatable member rotatable about a first axis, at least one substrate head assembly supported on said rotatable member, and at least two polishing surfaces arranged below said rotatable support at respective angular positions about said first axis, said method comprising the steps of

mounting a substrate onto a first one of said at least one substrate head assembly;

rotating said rotatable member to a position so that said substrate overlies a selected one of said polishing surfaces;

engaging said substrate with said selected polishing surface; and

imparting relative linear movement between said selected polishing surface and said first substrate head assembly while said substrate is engaged with said selected polishing surface.

13. (Withdrawn) The method of Claim 12, wherein said at least one substrate assembly comprises at least two substrate head assemblies.

14. (Withdrawn) The method of Claim 13, wherein said imparting step moves said first substrate head assembly along a radius with respect to said first axis.

15. (Withdrawn) The method of Claim 14, wherein said imparting step includes moving said polishing surface.

Attorney's Docket No.: 05542-170006 / 881D5/CMP

16. (Withdrawn) The method of Claim 15, wherein said imparting step includes moving said polishing surface.
17. (Withdrawn) The method of Claim 16, wherein said moving step includes rotating said polishing surface about an axis parallel to said first axis.
18. (Withdrawn) The method of Claim 17, wherein said substrate head assemblies can rotate substrates attached thereto about second axes parallel to said first axis.
19. (Currently Amended) A polishing apparatus, comprising:
a support member rotatable about a first axis;
at least two polishing surfaces arranged about said first axis;
at least two substrate head assemblies each capable of supporting thereon at least one substrate in contact with a selected one of said polishing surfaces and each being supported on said support member, reciprocal movement being provided between said substrate head assembly and said selected polishing surface during engagement of said substrate with said selected polishing surface.
20. (Original) The polishing apparatus of Claim 19, wherein said substrate head assemblies are linearly and reciprocally movable in said support member independently of each other.
21. (Previously Presented) The polishing apparatus of Claim 28, further comprising at least two motors mounted on said support member and coupled to respective ones of said substrate head assemblies to move them linearly and reciprocally in said support member.
22. (Original) The polishing apparatus of Claim 21, wherein said substrate head assemblies are slidably mounted in respective linear slots formed in said support member, and

further comprising:

at least two lead screws independently rotated by respective ones of said motors; and threaded members mounted to respective ones said substrate head assemblies and threadably and rotatably receiving respective ones of said lead screws.

23. (Original) The polishing apparatus of Claim 22, wherein said slots have open ends in said support member opposite said first axis and wherein each of said substrate head assemblies includes a respective head motor, and a substrate holder for selectively holding a substrate, wherein said substrate head assemblies are insertable in said slots from said open ends with said head motors disposed above and extending laterally of said slots and with said substrate holders disposed below and extending laterally of said slots.

24. (Previously Presented) The polishing apparatus of Claim 23, wherein each of said substrate head assemblies is capable of rotating about a head axis of said substrate head assembly, said head axis being substantially parallel to said first axis.

25. (Original) The polishing apparatus of Claim 24, wherein said substrate head assemblies are linearly and reciprocally movable along respective radii of said support member passing through said first axis.

26. (Currently Amended) The polishing apparatus of Claim 25, wherein each of said substrate head assemblies includes a vertically movable substrate head providing sufficient vertical movement to engage and disengage a substrate held thereon from said polishing surface.

27. (Withdrawn) The polishing apparatus of Claim 12, wherein said polishing surfaces are arranged below said rotatable support and wherein said rotating step causes said substrate to overly said selected one of said polishing surfaces.

Attorney's Docket No.: 05542-170006 / 881D5/CMP

28. (Previously Presented) The polishing apparatus of Claim 19, wherein said substrate head assemblies are capable of linear and reciprocal motion with respect to said support member.

29. (Previously Presented) A polishing apparatus, comprising:
(N+1) substrate head assemblies each capable of supporting thereon a respective substrate, wherein N is greater than 1;
a support member rotatable about an axis and supporting said substrate head assemblies at (N+1) first positions equiangularly disposed about said axis;
a load/unload mechanism for transferring a substrate to and from any of said substrate head assemblies rotated to a position adjacent thereto; and
N polishing surfaces engageable with respective ones of substrates supported on said substrate head assemblies;
wherein said N polishing surfaces and said load/unload mechanism are located to allow said N polishing surfaces to engage respective ones of N substrates supported on N of said substrate head assemblies while said load/unload mechanism is transferring another substrate to or from yet another of said substrate head assemblies.

30. (Previously Presented) The polishing apparatus of Claim 29, wherein said N polishing surfaces and said (N+1) substrate head assemblies provide rotary engagement between said N polishing surfaces and corresponding ones of N substrates.

31. (Previously Presented) The polishing apparatus of Claim 30, wherein said N polishing surfaces and said (N+1) substrate head assemblies provide additional linear and reciprocal engagement between said N polishing surfaces and corresponding ones of N substrates.

32. (Withdrawn) A polishing method practiced on an apparatus comprising (a) a rotatable support supporting a plurality of rotatable substrate heads capable of supporting a substrate

Attorney's Docket No.: 05542-170006 / 881D5/CMP

thereon and (b) a plurality rotatable platens having respective polishing surfaces, comprising the steps of:

rotating said support to a polishing position to allow one of said substrate heads to engage a substrate supported thereon with one of said polishing surfaces associated with one of said platens;

rotating said one substrate head about a first axis;

rotating said one platen about a second axis; and

providing motion between one platen and said one substrate head while said substrate is engaged with said one polishing surface to produce reciprocal and periodic variation of a distance between said first and second axes.

33. (Withdrawn) The polishing method of Claim 32, wherein said support is rotatable to a plurality of polishing positions allowing said one substrate head to engage said substrate with any of said polishing surfaces.

34. (Withdrawn) The polishing method of Claim 33, wherein a plurality of substrates supported on respective ones of said substrate heads are capable of being simultaneous engaged with a plurality of said polishing surfaces.

35. (Withdrawn) The polishing method of Claim 32, further comprising:
an initial step of rotating said support to position said one substrate head at a load/unload position; and
loading said substrate to said one substrate head positioned at said load/unload position;
a final step of rotating said support to position said one substrate head at said load/unload position; and
unloading said substrate from said one substrate head positioned at said load/unload position.

Attorney's Docket No.: 05542-170006 / 881D5/CMP

36. (Previously Presented) A polishing apparatus, comprising:
a plurality of substrate heads rotatable about respective first axes and capable of supporting respective substrates thereon;
a plurality of platens rotatable about respective second axes and having respective polishing surfaces;
a rotatable support supporting said substrate heads and capable of positioning any of said substrate heads at polishing positions adjacent any of said platens;
wherein one of said substrate heads located at one of said polishing positions and one of said platens located at said one polishing position are movable toward and away from each other providing periodic variation of a distance between said first and second axes associated with said one substrate head and said one platen.
37. (Previously Presented) The polishing apparatus of Claim 36, comprising (N+1) of said substrate heads and N of said polishing stations located at N polishing positions, where $N > 1$; and
further comprising a load/unload station disposed at a load/unload position for transferring substrates to and from any of said substrate heads;
wherein said N polishing positions and said load/unload positions are located at (N+1) positions equiangularly arranged about a rotation axis of said support.
38. (Previously Presented) A polishing apparatus, comprising:
a support member rotatable about a first axis;
at least two polishing surfaces arranged at respective angular positions about said first axis;
at least one substrate head assembly supported on said support member, the substrate head assembly:
having a central axis substantially parallel to but offset from the first axis;
capable of supporting thereon a substrate in contact with a selected one of the

polishing surfaces; and

linearly and reciprocally movable in the support member along a radii of the support member passing through the first axis, thereby affording relative linear movement between the selected polishing surface and the substrate head assembly while the substrate supported on the substrate head assembly is engaged with the selected polishing surface.

39. (Previously Presented) The polishing apparatus of claim 38, wherein the at least two polishing surfaces are rotatable.

40. (Previously Presented) The polishing apparatus of claim 39, wherein the at least one substrate head assembly comprises at least two substrate head assemblies, each capable of supporting thereon a substrate, the two substrate head assemblies being simultaneously positionable to respective positions corresponding to respective ones of the at least two polishing surfaces.

41. (Previously Presented) The polishing apparatus of claim 40, further comprising: at least two motors mounted on the support member and coupled to respective ones of the substrate head assemblies to move them linearly and reciprocally in the support member.

42. (Previously Presented) The polishing apparatus of claim 41, wherein each of the substrate head assemblies includes a vertically movable substrate head providing sufficient vertical movement to engage and disengage a substrate held thereon from the respective selected polishing surface.—
